

1A, 12V, Rail-to-Rail I/O

High Output Current Operational Amplifiers

Features

- Peak Output Current: 1A
- High Slew Rate: 40V/ μ s
- 55 MHz @ -3dB bandwidth
- Single or Dual Supply Operation:
 - 4.5V ~ 12V
 - ± 2.25 V ~ ± 6 V
- Rail-to-Rail Input and Output (RRIO)
- Low Quiescent Current: 2.3mA
- Unity Gain Stable
- No Phase Reversal
- Over Current Protection
- Over Temperature Protection
- Output Short Protection
- Extended Temperature Ranges
From -40°C to +125°C
- Small Packaging:
DFN3x3-8/SOP8-EP/SOP8

Applications

- Audio Applications
- Twisted-pair Line Drivers
- LCD TVs
- Monitors
- Laptops
- TFT-LCD Panels

General Description

The COS8397 (dual) comprises two high slew rate, voltage feedback amplifiers. The output stage is capable of delivering approximately 1A peak current. The COS8397 operates on single supply from 4.5V to 12V or dual supplies from ± 2.25 V to ± 6 V. They have bandwidth and slew rate typically found in current feedback amplifiers. The wide bandwidth and fast slew rate make these amplifiers useful in many general purpose, high speed applications.

The COS8397 provides excellent overall performance and versatility. The output voltage swing extends to within 0.5V of each rail while driving a 50 Ω load, providing the maximum output dynamic range with excellent overdrive recovery. The features make the COS8397 ideal for applications that require a large signal swing into a heavy load.

The COS8397 is available in Green DFN3x3-8, SOP8 and SOP8-EP (Exposed Pad) package.

1. Pin Configuration and Functions

Pin Functions

Name	Description	Note
+Vs	Positive power supply	A bypass capacitor of 0.1 μ F as close to the part as possible should be placed between power supply pins or between supply pins and ground.
-Vs	Negative power supply or ground	If it is not connected to ground, bypass it with a capacitor of 0.1 μ F as close to the part as possible.
-IN	Negative input	Inverting input of the amplifier. Voltage range of this pin can go from -Vs -0.3V to +Vs + 0.3V.
+IN	Positive input	Non-inverting input of the amplifier. This pin has the same voltage range as -IN.
OUT	Output	The output voltage range extends to within millivolts of each supply rail.
EP	Exposed Thermal Pad	Connect to -Vs or ground

2. Package and Ordering Information

Channel	Model	Package	Order Number	Package Option	Marking Information
2	COS8397	SOP-8-EP	COS8397SRE	Tape and Reel, 4000	COS8397
		SOP-8	COS8397SR	Tape and Reel, 4000	COS8397
		DFN3x3-8	COS8397DN	Tape and Reel, 4000	COS8397

3. Product Specification

3.1 Absolute Maximum Ratings ⁽¹⁾

Parameter	Rating	Units
Power Supply: +Vs to -Vs	13	V
Input Voltage	-Vs -0.5V to +Vs + 0.5V	V
Input Current ⁽²⁾	10	mA
Storage Temperature Range	-65 to 150	°C
Junction Temperature	150	°C
Operating Temperature Range	-40 to 125	°C
ESD Susceptibility, HBM	2000	V

(1) Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current-limited to 10mA or less.

3.2 Thermal Data

Parameter	Rating	Unit
Package Thermal Resistance, $R_{\theta JA}$ (Junction-to-ambient)	155 (SOP8) 47 (SOP8-EP) 43 (DFN8-3x3)	°C/W

3.3 Recommended Operating Conditions

Parameter	Rating	Unit
DC Supply Voltage	4.5 (±2.25) ~12 (±6)	V
Operating ambient temperature	-40 to +125	°C

3.4 Electrical Characteristics

(+V_S=12V, -V_S=0, V_{CM}=+V_S/2 and R_L=25Ω. Typical value are at T_A=+25°C, unless otherwise noted)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit

Thermal Shutdown Hysteresis	ΔT_{SHDN}			30		°C

4.0 Application Notes

Driving Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop's phase margin decreases, and the closed loop bandwidth is reduced. This produces gain peaking in the frequency response, with overshoot and ringing in the step response. A unity gain buffer ($G = +1$) is the most sensitive to capacitive loads, but all gains show the same general behavior.

When driving large capacitive loads with these op amps (e.g., > 100 pF when $G = +1$), a small series resistor at the output (R_{ISO} in Figure 1) improves the feedback loop's phase margin (stability) by making the output load resistive at higher frequencies. It does not, however, improve the bandwidth.

To select R_{ISO} , check the frequency response peaking (or step response overshoot) on the bench. If the response is reasonable, you do not need R_{ISO} . Otherwise, start R_{ISO} at $1\text{ k}\Omega$ and modify its value until the response is reasonable.

Figure 1. Indirectly Driving Heavy Capacitive Load

An improvement circuit is shown in Figure 2. It provides DC accuracy as well as AC stability. R_F provides the DC accuracy by connecting the inverting signal with the output, C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving phase margin in the overall feedback loop.

Figure 2. Indirectly Driving Heavy Capacitive Load with DC Accuracy

For the inverting configuration, there are two others ways to increase the phase margin: (a) by increasing the amplifier's gain or (b) by placing a capacitor in parallel with the feedback resistor to counteract the parasitic capacitance associated with inverting node, as shown in Figure 3.

Figure 3. Adding a Feedback Capacitor in the inverting Configuration

Power-Supply Bypassing and Layout

The COS8397 operates from a single +4.5V to +12V supply or dual $\pm 2.25V$ to $\pm 6V$ supplies. For single-supply operation, bypass the power supply +Vs with a $0.1\mu F$ ceramic capacitor which should be placed close to the +Vs pin. For dual-supply operation, both the +Vs and the -Vs supplies should be bypassed to ground with separate $0.1\mu F$ ceramic capacitors. $2.2\mu F$ tantalum capacitor can be added for better performance.

The length of the current path is directly proportional to the magnitude of parasitic inductances and thus the high frequency impedance of the path. High speed currents in an inductive ground return create an unwanted voltage noise. Broad ground plane areas will reduce the parasitic inductance. Thus a ground plane layer is important for high speed circuit design.

Typical Application Circuits

Differential Amplifier

The circuit shown in Figure 4 performs the differential function. If the resistors ratios are equal ($R_4 / R_3 = R_2 / R_1$), then $V_{OUT} = (V_{IP} - V_{IN}) \times R_2 / R_1 + V_{REF}$.

Figure 4. Differential Amplifier

Low Pass Active Filter

When receiving low-level signals, limiting the bandwidth of the incoming signals into the system is often required. The simplest way to establish this limited bandwidth is to place an RC filter at the noninverting terminal of the amplifier. If even more attenuation is needed, a multiple pole filter is required. The Sallen-Key filter can be used for this task, as Figure 5. For best results, the amplifier should have a bandwidth that is 8 to 10 times the filter frequency bandwidth. Failure to follow this guideline can result in reduction of phase margin. The large values of feedback resistors can couple with parasitic capacitance and cause undesired effects such as ringing or oscillation in high-speed amplifiers. Keep resistors value as low as possible and consistent with output loading consideration.

Figure 5. Two-Pole Low-Pass Sallen-Key Active Filter
